

第九、十章单元测验

姓名: _____ 学号: _____

1、设 $z = f(xy, \frac{x}{y}) + \sin y$, 其中 f 具有二阶连续偏导数, 求 $\frac{\partial z}{\partial x}$, $\frac{\partial^2 z}{\partial x \partial y}$.

解: $\frac{\partial z}{\partial x} = (f'_1 \cdot y + f'_2 \cdot \frac{1}{y}) + 0 = yf'_1 + \frac{1}{y}f'_2,$

$$\begin{aligned}\frac{\partial^2 z}{\partial x \partial y} &= f'_1 + y[f''_{11} \cdot x + f''_{12} \cdot (-\frac{x}{y^2})] - \frac{1}{y^2}f'_2 + \frac{1}{y}[f''_{21} \cdot x + f''_{22} \cdot (-\frac{x}{y^2})] \\ &= f'_1 + xyf''_{11} - \frac{1}{y^2}f'_2 - \frac{x}{y^3}f''_{22}.\end{aligned}$$

2、求曲线 $\Gamma: \begin{cases} x+y+z=0 \\ x^2+y^2+z^2=1 \end{cases}$ 在点 $M_0(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}, 0)$ 处的切线和法平面.

解: 分别对 x 求导

$$\begin{cases} 1 + \frac{dy}{dx} + \frac{dz}{dx} = 0 \\ 2x + 2y\frac{dy}{dx} + 2z\frac{dz}{dx} = 0 \end{cases}$$

$$\left. \frac{dy}{dx} \right|_{M_0} = \frac{x-z}{z-y} \bigg|_{(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}, 0)} = \frac{\frac{1}{\sqrt{2}}}{-\frac{1}{\sqrt{2}}} = -1$$

$$\left. \frac{dz}{dx} \right|_{M_0} = \frac{x-y}{y-z} \bigg|_{(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}, 0)} = \frac{\frac{1}{\sqrt{2}}}{-\frac{1}{\sqrt{2}}} = -1$$

切线方程: $\frac{x - \frac{1}{\sqrt{2}}}{1} = \frac{y + \frac{1}{\sqrt{2}}}{1} = \frac{z - 0}{-2}$

法平面方程: $\left(x - \frac{1}{\sqrt{2}}\right) + \left(y + \frac{1}{\sqrt{2}}\right) + (-2)(z - 0) = 0$, 即 $x + y - 2z = 0$.

3、求函数 $u = \ln(x + \sqrt{y^2 + z^2})$ 在点 $A(1, 0, 1)$ 处沿点 A 指向 $B(3, -2, 2)$ 方向的方向导数.

解: $AB = (2, -2, 1)$, 则

$$l = AB^0 = \left(\frac{2}{3}, -\frac{2}{3}, \frac{1}{3} \right) = \{\cos \alpha, \cos \beta, \cos \gamma\}$$

$$\left. \frac{\partial u}{\partial x} \right|_A = \frac{d \ln(x+1)}{dx} \Big|_{x=1} = \frac{1}{2},$$

$$\left. \frac{\partial u}{\partial y} \right|_A = \frac{d \ln(x+1)}{dy} \Big|_{y=0} = 0,$$

$$\left. \frac{\partial u}{\partial z} \right|_A = \frac{1}{2}$$

$$\therefore \frac{\partial u}{\partial l} = \frac{\partial u}{\partial x} \cos \alpha + \frac{\partial u}{\partial y} \cos \beta + \frac{\partial u}{\partial z} \cos \gamma = \frac{1}{2}$$

4、计算 $\lim_{t \rightarrow 0^+} \frac{1}{1-e^{-t^2}} \int_0^t dx \int_x^t e^{-(x-y)^2} dy$.

解：交换积分次序，得累次积分为 $\int_0^t dx \int_x^t e^{-(x-y)^2} dy = \int_0^t dy \int_0^y e^{-(x-y)^2} dx$

从而，由罗必塔法则

$$\begin{aligned} \lim_{t \rightarrow 0^+} \frac{1}{1-e^{-t^2}} \int_0^t dx \int_x^t e^{-(x-y)^2} dy &= \lim_{t \rightarrow 0^+} \frac{\int_0^t dy \int_0^y e^{-(x-y)^2} dx}{-(-t^2)} \\ &= \lim_{t \rightarrow 0^+} \frac{\int_0^t e^{-(x-t)^2} dx}{2t} \\ &= \lim_{t \rightarrow 0^+} \frac{\int_{-t}^0 e^{-u^2} du}{2t} \\ &= \lim_{t \rightarrow 0^+} \frac{-e^{-(-t)^2} \cdot (-1)}{2} = \frac{1}{2} \end{aligned}$$

5、设 $f(x)$ 在 $[a, b]$ 上连续，证明： $\left[\int_a^b f(x) dx \right]^2 \leq (b-a) \int_a^b f^2(x) dx$.

证明：令 $D = \{(x, y) \mid a \leq x \leq b, a \leq y \leq b\}$ ，则

$$\begin{aligned} \left[\int_a^b f(x) dx \right]^2 &= \iint_D f(x) f(y) dx dy \leq \frac{1}{2} \iint_D [f^2(x) + f^2(y)] dx dy \\ &= \frac{1}{2} \left[\int_a^b dy \int_a^b f^2(x) dx + \int_a^b dx \int_a^b f^2(y) dy \right] \\ &= \frac{b-a}{2} \left[\int_a^b f^2(x) dx + \int_a^b f^2(y) dy \right] \\ &= (b-a) \int_a^b f^2(x) dx \end{aligned}$$

6、求锥面 $z = \sqrt{x^2 + y^2}$ 被柱面 $z^2 = 2x$ 所割下部分面积

解:

$$\begin{cases} z^2 = x^2 + y^2 \\ z^2 = 2x \end{cases} \Rightarrow x^2 + y^2 = 2x, \text{投影区域 } D: x^2 + y^2 \leq 2x;$$

$$\frac{\partial z}{\partial x} = \frac{x}{\sqrt{x^2 + y^2}} \quad \frac{\partial z}{\partial y} = \frac{y}{\sqrt{x^2 + y^2}} \quad \sqrt{1 + z_x'^2 + z_y'^2} = \sqrt{2}$$

$$\text{所以面积 } A = \iint_D \sqrt{2} dx dy = 2 \int_0^{\frac{\pi}{2}} d\theta \int_0^{2\cos\theta} \sqrt{2} r dr = 2\sqrt{2} \int_0^{\frac{\pi}{2}} \frac{(2\cos\theta)^2}{2} d\theta = \sqrt{2}\pi$$

7、把重积分 $\iint_D f(x, y) dx dy$ 表为极坐标形式的二次积分, 其中积分区域

$$D = \{(x, y) | x^2 \leq y \leq 1, -1 \leq x \leq 1\}.$$

解 在极坐标下积分区域可表示为 $D = D_1 + D_2 + D_3$,

$$\text{其中 } D_1: 0 \leq \theta \leq \frac{\pi}{4}, 0 \leq \rho \leq \tan\theta \sec\theta,$$

$$D_2: \frac{\pi}{4} \leq \theta \leq \frac{3\pi}{4}, 0 \leq \rho \leq \csc\theta,$$

$$D_3: \frac{3\pi}{4} \leq \theta \leq \pi, 0 \leq \rho \leq \tan\theta \sec\theta,$$

$$\begin{aligned} \text{所以 } \iint_D f(x, y) dx dy &= \int_0^{\frac{\pi}{4}} d\theta \int_0^{\tan\theta \sec\theta} f(\rho \cos\theta, \rho \sin\theta) \rho d\rho \\ &\quad + \int_{\frac{\pi}{4}}^{\frac{3\pi}{4}} d\theta \int_0^{\csc\theta} f(\rho \cos\theta, \rho \sin\theta) \rho d\rho \\ &\quad + \int_{\frac{3\pi}{4}}^{\pi} d\theta \int_0^{\tan\theta \sec\theta} f(\rho \cos\theta, \rho \sin\theta) \rho d\rho. \end{aligned}$$

8、计算二重积分 $I = \iint_D (x^2 + xye^{x^2+y^2}) dx dy$, 其中:

(1) D 为圆域 $x^2 + y^2 \leq 1$;

(2) D 由直线 $y = x$, $y = -1$, $x = 1$ 所围成.

解: (1) 利用对称性.

$$\begin{aligned} I &= \iint_D x^2 dx dy + \iint_D xye^{x^2+y^2} dx dy \\ &= \frac{1}{2} \iint_D (x^2 + y^2) dx dy + 0 \\ &= \frac{1}{2} \int_0^{2\pi} d\theta \int_0^1 r^3 dr = \frac{\pi}{4} \end{aligned}$$

(2) 积分域如图： 添加辅助线 $y = -x$ ，将 D 分为 D_1, D_2 , 利用对称性，得

$$\begin{aligned} I &= \iint_D x^2 dx dy + \iint_{D_1} x y e^{x^2+y^2} dx dy + \iint_{D_2} x y e^{x^2+y^2} dx dy \\ &= \int_{-1}^1 x^2 dx \int_{-1}^x dy + 0 + 0 = \frac{2}{3} \end{aligned}$$

9、 $\iiint_{\Omega} (y^2 + z^2) dv$ ，其中 Ω 是由 xoy 面上曲线 $y^2 = 2x$ 绕 x 轴旋转而成的曲面与平面 $x = 5$ 所围成的闭区域。

解 曲线 $y^2 = 2x$ 绕 x 轴旋转而成的曲面的方程为 $y^2 + z^2 = 2x$ 。由曲面 $y^2 + z^2 = 2x$ 和平面 $x = 5$ 所围成的闭区域 Ω 在 yOz 面上的投影区域为

$$D_{yz}: y^2 + z^2 \leq (\sqrt{10})^2,$$

在柱面坐标下此区域又可表示为

$$D_{yz}: 0 \leq \theta \leq 2\pi, 0 \leq \rho \leq \sqrt{10}, \frac{1}{2}\rho^2 \leq x \leq 5,$$

所以
$$\iiint_{\Omega} (y^2 + z^2) dv = \int_0^{2\pi} d\theta \int_0^{\sqrt{10}} d\rho \int_{\frac{1}{2}\rho^2}^5 \rho^2 \cdot \rho dx$$

$$= 2\pi \int_0^{\sqrt{10}} \rho^3 (5 - \frac{1}{2}\rho^2) d\rho = \frac{250}{3}\pi.$$

10、设函数 $f(x, y) = e^{-x}(ax + b - y^2)$ ，若 $f(-1, 0)$ 为 $f(x, y)$ 的极大值，求常数 a, b 满足的条件。

解：由题设应有
$$\begin{cases} f_x(-1, 0) = e^{-x}(-ax - b + y^2 + a)|_{(-1, 0)} = e(2a - b) = 0 \\ f_y(-1, 0) = -2ye^{-x}|_{(-1, 0)} = 0 \end{cases}$$

既有 $2a = b$ 。

又 $A = f_{xx}(-1, 0) = -ea$ ， $B = f_{xy}(-1, 0) = 0$ ， $C = f_{yy}(-1, 0) = -2e$

因此当 $a > 0$ ， $b = 2a$ 时， $AC - B^2 = 2ae^2 > 0$ ， $f(-1, 0)$ 为 $f(x, y)$ 的极大值；

当 $a < 0$ 时， $f(-1, 0)$ 一定不是 $f(x, y)$ 的极大值；

当 $a = 0$ ， $b = 0$ 时， $f(x, y) = -ye^{-x} \leq f(-1, 0)$ ，因而 $f(-1, 0)$ 也为 $f(x, y)$ 的极大值。
