

习题课第六章

习题课 第六章

$$\begin{aligned}
 4. \text{解: } E(X) &= \int_{-\infty}^{+\infty} x f(x) dx \\
 &= \int_a^{+\infty} x \cdot \frac{1}{\theta} \cdot e^{-\frac{x-a}{\theta}} dx \\
 &\quad (\text{令 } y = x - a) \\
 &= \underline{\theta + a}
 \end{aligned}$$

$$\begin{aligned}
 D(X) &= E(X - EX)^2 \\
 &= \int_{-\infty}^{+\infty} (x - \theta - a)^2 f(x) dx \\
 &= \int_a^{+\infty} (x - \theta - a)^2 \cdot \frac{1}{\theta} \cdot e^{-\frac{x-a}{\theta}} dx \\
 &= \theta^2
 \end{aligned}$$

$$\therefore \begin{cases} E(X) = \theta + a \\ D(X) = \theta^2 \end{cases} \Rightarrow \begin{cases} \theta = \sqrt{D(X)} \\ a = \underline{E(X)} - \underline{\sqrt{D(X)}} \end{cases}$$

样方差估计总体方差.

$$\therefore \theta \text{ 的矩估计 } \hat{\theta} = \sqrt{S_n^2} = S_n$$

$$a \text{ 的矩估计 } a = \bar{X} - S_n$$

6. 解: $X \sim B(1, p)$

$$\begin{aligned} P(X=k) &= C_1^k \cdot p^k \cdot (1-p)^{1-k}, \quad k=0, 1 \\ &= \underline{p^k \cdot (1-p)^{1-k}} \end{aligned}$$

基于观测样本 $x_1, \dots, x_n$, 似然函数可

表示为

$$\begin{aligned} L(p) &= \prod_{i=1}^n \underline{P(X=x_i)} \\ &= \prod_{i=1}^n p^{x_i} \cdot (1-p)^{1-x_i} \end{aligned}$$

$$= p^{\sum_{i=1}^n x_i} \cdot (1-p)^{n - \sum_{i=1}^n x_i}$$

则对数似然为：

$$\begin{aligned} l(p) = \log L(p) &= \left(\sum_{i=1}^n x_i \right) \cdot \log p \\ &+ \left(n - \sum_{i=1}^n x_i \right) \cdot \log(1-p). \end{aligned}$$

$$\frac{dl(p)}{dp} = 0, \text{ 得}$$

$$\frac{\sum_{i=1}^n x_i}{p} - \frac{n - \sum_{i=1}^n x_i}{1-p} = 0$$

$$\text{解得 } p = \frac{1}{n} \sum_{i=1}^n x_i = \underline{\bar{x}}$$

$\therefore p$ 的最大似然估计为 $\hat{p} = \bar{x}$.

8. 解:

$$X \sim U(a, b).$$

$$f(x) = \begin{cases} \frac{1}{b-a}, & a \leq x \leq b \\ 0, & \text{其他.} \end{cases}$$

基于观测样本 $x_1, \dots, x_n$, 似然函数为

$$L(a, b) = \begin{cases} \left(\frac{1}{b-a} \right)^n, & a \leq x_1, x_2, \dots, x_n \leq b \\ 0, & \text{其他.} \end{cases}$$

$$b \geq x_1, b \geq x_2, \dots, b \geq x_n$$

$$\Downarrow$$

$$b \geq \max\{x_1, x_2, \dots, x_n\}.$$

$$b_{\min} = \max\{x_1, \dots, x_n\},$$

$$a \leq x_1, a \leq x_2, \dots, a \leq x_n$$

$$\underline{a} \leq \min \{x_1, x_2, \dots, x_n\}.$$

$$a_{\max} = \min \{x_1, x_2, \dots, x_n\}.$$

$\therefore b = \underline{b_{\min}}, a = \underline{a_{\max}}$ 时, $L(a, b)$ 最大.

$\therefore a, b$ 的最大似然估计为

$$\hat{a} = \min \{x_1, x_2, \dots, x_n\}.$$

$$\hat{b} = \max \{x_1, x_2, \dots, x_n\}.$$

13. 解: μ 的 $1-\alpha$ 的置信区间为:

$$\left[\bar{X} - \frac{S}{\sqrt{n}} \cdot t_{\alpha/2}(n-1), \bar{X} + \frac{S}{\sqrt{n}} \cdot t_{\alpha/2}(n-1) \right]$$

代入数据, $\bar{X} = 1147$, $n = 10$, $S = 87$

$$\alpha = 0.05, \quad t_{\alpha/2}(n-1) = \underline{t_{0.025}(9)} = 2.262$$

21. 解: 依题意, 考虑如下检验问题:

$$H_0: \mu = 12100 \quad \longleftrightarrow \quad H_1: \mu \neq 12100$$

$$\text{选取检验统计量 } T = \frac{\bar{X} - \mu}{S/\sqrt{n}}$$

$$\text{其拒绝域为 } |T_{obs}| > \underline{t_{\alpha/2}(n-1)}$$

代入数据: $n = 24$, $\bar{X} = 11958$, $S = 316$

得 T 的观测值为

$$T_{obs} = \frac{11958 - 12100}{316 / \sqrt{24}} = -2.20$$

$$\underline{t_{\alpha/2}(n-1)} = t_{0.025}(23) = \underline{2.069}$$

$$|T_{obs}| = 2.20 > \underline{t_{\alpha/2}(n-1)}$$

∴ 落在拒绝域内，因此拒绝 H_0 ，认为发热量的期望值不是 12100。
